高校卒業レベル　オリジナル長文語句空所補充

L03 Long-Passage Gap Filling ｜ 生徒用問題・ワークシート・校内試行版

説明文 2 題｜空所補充 6 問｜4 肢選択｜完全オリジナル

Today’s Goal｜今日のゴール

空所のある文だけでなく、前後の文と段落全体の役割を使って 6 問を 10 分以内で解く。

構成	説明文 2 題・各 3 問
解答形式	各問 4 肢選択
目標時間	10 分
読み方	段落の主張→空所前後→選択肢の順

次の英文 A、B を読み、文意にそって(18)〜(23)の空所に入る最も適切なものを 1〜4 から一つ選びなさい。

Passage A Sharing More Than Books

Public libraries have traditionally lent books, but some are now lending other useful objects as well. At a service known as a library of things, people may find tools, cooking equipment, board games, or even small machines. Many of these objects are expensive and are needed only a few times a year. (18) without spending money on something that will usually remain unused at home.

The system can also benefit the environment. Making a new product requires raw materials and energy, and delivering it to a store produces additional carbon emissions. If twenty families share one electric drill, for example, (19). Sharing can also keep unwanted objects out of the trash, especially when a library accepts donated items that are still in good condition.

Running such a service is not as simple as placing objects on shelves. Tools must be checked regularly, and users need clear instructions. Some libraries ask volunteers with repair skills to inspect each object. Staff members may also show borrowers how to use an unfamiliar machine before they take it home. These extra steps require time, (20). With careful management, a library of things can make useful objects available to more people while reducing unnecessary purchases.

(18)

1 Libraries can sell these products	2 Visitors must return every book
3 Residents can borrow what they need	4 Manufacturers can advertise new items

(19)

1 fewer new drills need to be produced	2 each family must learn to repair it
3 the library has to buy twenty shelves	4 the drill will use much more electricity

(20)

1 so most libraries refuse all donations	2 unless borrowers purchase the machines
3 because books are difficult to organize	4 but they help the service operate safely

Passage B Cool Roofs, Cooler Neighborhoods

On hot summer days, cities are often warmer than nearby rural areas. One reason is that cities contain many dark surfaces, including roads and roofs. These surfaces absorb energy from sunlight during the day and release it slowly later. As a result, (21), even after the sun has gone down. This can make summer nights uncomfortable and increase the need for air conditioning.

To deal with this problem, some building owners install cool roofs. They use light-colored or specially designed materials that reflect more sunlight than ordinary dark roofs. Because the roof absorbs less energy, (22). This may reduce the amount of electricity needed for cooling. If many buildings in one area use such roofs, the surrounding air may also become slightly cooler.

Cool roofs, however, are not a perfect solution for every building. Dust can make a roof less reflective, so it may need regular cleaning. In colder regions, a dark roof can sometimes help warm a building in winter, and replacing it may increase heating costs. The best material also depends on the shape of the building and the local weather. (23). Cool roofs can be a useful tool, but they work best as one part of a larger plan that also includes trees, shade, and energy-efficient buildings.

(21)

1 rural roads become crowded with cars	2 buildings and streets remain warm
3 people turn off their air conditioners	4 sunlight becomes stronger at midnight

(22)

1 the roof becomes darker each year	2 more sunlight enters through the windows
3 the building produces its own fuel	4 less heat enters the rooms below

(23)

1 Therefore, local conditions should be considered before installation	2 For example, every roof should be painted the same color
3 In addition, winter weather has disappeared from most cities	4 On the other hand, trees always increase heating costs

Answer Sheet and Review｜解答・振り返り

18 ____	19 ____	20 ____
21 ____	22 ____	23 ____

根拠メモ

_____

_____

_____

_____

_____

_____
